MENINGITIS VACCINATION RESPONSE FORM

Mailing Address: Street City State Zip Code What is meningitis? Meningitis is a bacterial or viral infection of the bloodstream or meninges (a thin lining covering the brain and spinal cord). Knowing whether meningits is caused by a virus or bacterium is important because of the severity of illness and the treatments differ. Meningococcal disease is caused by a virus or bacterium is important because of the severity of illness and the treatments differ. Meningococcal disease is caused by a virus or bacterium is important because of the severity of illness and the treatments differ. Meningococcal disease is caused by a virus or bacterium is important because of the severity of illness and the treatments differ. Meningococcal diseases is a single isolated event. Clusters of cases or outbreaks are rare in the U.S., however 10-15% of people who get meningitis deform the disease. Among the survivors, approximately 1 in 5 live with permanent disabilities, such as brain damage, hearing loss, loss of kidney function, or limb amputations. How is the disease spread? Meningococcal disease is transmitted through the air via droplets of respiratory secretions and direct contact. The disease is spread person-to-person through exchange of respiratory and throat secretions (i.e. shared items such as cigarettes, drinking glasses, eating utensils, or through intimate contact such as kissing). Although anyone can come in contact with the bacteria that causes this disease, data also indicates certain social behaviors may put students at increased risk for the disease. Patients with respiratory infections, compromised immunity, those in close contact to a known case, and travelers to endemic areas of the world are also at increased risk. What are the symptoms? The early symptoms usually associated with meningococcal disease include fever, severe headache, stiff neck, rash, nausea, vomiting, and lethargy, and may resemble the flu. Because the disease progresses rapidly, often in as little as 12 hours, students are urged to se	Name (please print):				
What is meningitis? Meningitis is a bacterial or viral infection of the bloodstream or meninges (a thin lining covering the brain and spinal cord). Knowing whether meningitis is caused by a virus or bacterium is important because of the severity of illness and the treatments differ. Meningococcal disease is caused by the bacterium Neisseria meningitidis which has at least 13 different subtypes. It is a relatively rare disease and usually occurs as a single isolated event. Clusters of cases or outbreaks are rare in the U.S., however 10-15% of people who get meningitis die from the disease. Almong the survivors, approximately 1 in 5 live with permanent disabilities, such as brain damage, hearing loss, loss of kidney function, or limb amputations. How is the disease spread? Meningococcal disease is transmitted through the air via droplets of respiratory secretions and direct contact. The disease is spread person-to-person through exchange of respiratory and throat secretions (i.e. shared items such as cigarettes, drinking glasses, eating utensils, or through initimate contact such as kissing). Although anyone can come in contact with the bacteria that causes this disease, data also indicates certain social behaviors may put students at increased risk for the disease. Patients with respiratory infections, compromised immunity, those in close contact to a known case, and travelers to endemic areas of the world are also at increased risk. What are the symptoms? The early symptoms usually associated with meningococcal disease include fever, severe headache, stiff neck, rash, nausea, vomiting, and lethargy, and may resemble the flu. Because the disease progresses rapidly, often in as little as 12 hours, students are urged to seek medical care immediately if they experience two or more of these symptoms concurrently. In overwhelming infections, shock, coma, and death can follow within several hours, even with appropriate medical reference to the sease and thours, even with a diagnosed case of meningitis be treated?
